## Homework 1

1. Draw the direction field for the following ODEs and determine the $t \rightarrow \infty$ behavior

$$
\begin{gathered}
y^{\prime}=4-y \\
y^{\prime}=y+2 \\
y^{\prime}=(y+1)(y-2)
\end{gathered}
$$

2. Classify the following differential equations by order and linearity

$$
\begin{gathered}
y^{(100)}+y^{\prime}=6 \\
y^{\prime \prime \prime}+t^{2} y^{\prime \prime}+t^{4} y^{\prime}-\cos t y=\sqrt{t} \\
y^{\prime}=y+\sin y
\end{gathered}
$$

3. Check if the given functions $\varphi(t)$ are solutions to the corresponding ODEs

$$
\begin{gathered}
\varphi(t)=\tan t, y^{\prime}=1+y^{2} \\
\varphi(t)=e^{t}+e^{-2 t}, y^{\prime \prime}+y^{\prime}-2 y=0 \\
\varphi(t)=1 / t, t^{2} y^{\prime \prime}-2 y=0 \\
\varphi(t)=\sin 2 t, y^{\prime \prime}+y=\sin 2 t
\end{gathered}
$$

4. (no need to write) Review the techniques of integration and make sure you are comfortable to $u$-substitution, integrating by parts and integration of $\cos ^{2} x, \sin ^{2} x$.
