

## Calculus 151 Problems, Week 5

1. Suppose  $f(x)$  is a differentiable function. Find expressions for the derivatives of the following functions in terms of  $f(x)$  and  $f'(x)$ :

$$\begin{array}{ll} \text{(a) } x^2 f(x) & \text{(b) } \frac{f(x)}{x^2} \\ \text{(c) } \frac{x^2}{f(x)} & \text{(d) } \frac{1 + xf(x)}{\sqrt{x}} \end{array}$$

2. Define

$$f(x) = \begin{cases} x^2 + p, & \text{if } x \geq 0 \\ 4 - x^2, & \text{if } x < 0 \end{cases} \quad g(x) = \begin{cases} px^2 + x, & \text{if } x \geq 0 \\ x^3 + p^2x, & \text{if } x < 0 \end{cases}$$

a) Find all values of  $p$  for which  $f(x)$  is continuous everywhere, and all values of  $p$  for which  $g(x)$  is continuous everywhere.

b) Now find all values of  $p$  (if there are any) so that  $f(x)$  is differentiable everywhere, and all values of  $p$  (if there are any) so that  $g(x)$  is differentiable everywhere. Draw the graphs of  $y = f(x)$  and  $y = g(x)$  for these values of  $p$ .

3. a) Find  $\lim_{x \rightarrow 0} \frac{3 \sin(8x)}{9x}$  and  $\lim_{x \rightarrow 0} \frac{x}{\tan(9x)}$ . Prove your answers using limit theorems.

b) Now find  $\lim_{x \rightarrow 0} \frac{x + 3 \sin(8x)}{\tan(9x)}$ . Prove your answer using limit theorems.

4. Define

$$f(x) = \begin{cases} x^{-1} \sin x & \text{if } x \neq 0 \\ 1 & \text{if } x = 0 \end{cases}$$

a) Graph  $y = f(x)$  in the range  $-2\pi \leq x \leq 2\pi$  and prove (by limit results) that  $f(x)$  is continuous for all  $x$ .

b) Find a formula for the derivative  $f'(x)$  when  $x \neq 0$ , and plot its graph in the same window as in a). Determine from your graphs the range of  $x$  values for which the tangent lines to  $y = f(x)$  have negative slope.

c) Does  $\lim_{x \rightarrow \infty} f(x)$  exist? Prove your answer. (*Hint*: use the Squeeze Theorem.)
